|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 120                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| described in the "Renal Disorders"      | section below), diabetic neuropathy, | (e a due to diabetic neuropathy)    | (e.g., une to maneur nemopauty),<br>blood vessel blockage, heart disease. | stroke, impotence (e.g., due to   | diabetic neuropathy or blood vessel | blockage), seizures, mental         | confusion, drowsiness, nonketotic  | hyperglycemic-hyperosmolar coma, | cardiovascular disease (e.g., heart    | disease, atherosclerosis,        | microvascular disease, hypertension,  | stroke, and other diseases and        | disorders as described in the         | "Cardiovascular Disorders" section   | below), dyslipidemia, endocrine | disorders (as described in the | "Endocrine Disorders" section        | below), neuropathy, vision          | impairment (e.g., diabetic retinopathy | and blindness), ulcers and impaired | wound healing, and infection (e.g.,     | infectious diseases and disorders as  | described in the "Infectious          | Diseases" section below, especially          | of the urinary tract and skin), carpal | tunnel syndrome and Dupuytren's     | contracture). An additional highly    | preferred indication is obesity and/or | complications associated with        | obesity. Additional highly preferred | indications include weight loss or | alternatively, weight gain. Additional  | highly preferred indications are       | complications associated with insulin | resistance.               |
|-----------------------------------------|--------------------------------------|-------------------------------------|---------------------------------------------------------------------------|-----------------------------------|-------------------------------------|-------------------------------------|------------------------------------|----------------------------------|----------------------------------------|----------------------------------|---------------------------------------|---------------------------------------|---------------------------------------|--------------------------------------|---------------------------------|--------------------------------|--------------------------------------|-------------------------------------|----------------------------------------|-------------------------------------|-----------------------------------------|---------------------------------------|---------------------------------------|----------------------------------------------|----------------------------------------|-------------------------------------|---------------------------------------|----------------------------------------|--------------------------------------|--------------------------------------|------------------------------------|-----------------------------------------|----------------------------------------|---------------------------------------|---------------------------|
| proliferation of pancreatic beta cells. | For example, the Cell Titer-Gio      | measures the number of viable cells | in culture based on quantitation of                                       | the ATP present which signals the | presence of metabolically active    | cells. Exemplary assays that may be | used or routinely modified to test | regulation of viability and      | proliferation of pancreatic beta cells | by polypeptides of the invention | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in: Friedrichsen BN, | et al., Mol Endocrinol, 15(1):136-48 | (2001); Huotari MA, et al.,     | Endocrinology, 139(4):1494-9   | (1998); Hugl SR, et al., J Biol Chem | 1998 Jul 10;273(28):17771-9 (1998), | the contents of each of which is       | herein incorporated by reference in | its entirety. Pancreatic cells that may | be used according to these assays are | publicly available (e.g., through the | ATCC <sup>TM</sup> ) and/or may be routinely | generated. Exemplary pancreatic        | cells that may be used according to | these assays include rat INS-1 cells. | INS-1 cells are a semi-adherent cell   | line established from cells isolated | from an X-ray induced rat            | transplantable insulinoma. These   | cells retain characteristics typical of | native pancreatic beta cells including | glucose inducible insulin secretion.  | References: Asfari et al. |

|   | regulated by cytokines, growth         | infection (e.g., as described below    |
|   | factors, and hormones are well         | under "Infectious Disease"). Highly    |
|   | known in the art and may be used or    | preferred indications include          |
|   | routinely modified to assess the       | autoimmune diseases (e.g.,             |
|   | ability of polypeptides of the         | rheumatoid arthritis, systemic lupus   |
|   | invention (including antibodies and    | erythematosis, multiple sclerosis      |
|   | agonists or antagonists of the         | and/or as described below) and         |
|   | invention) to mediate                  | inmunodeficiencies (e.g., as           |
|   | immunomodulation and                   | described below). Highly preferred     |
|   | differentiation and modulate T cell    | indications also include boosting a B  |
|   | proliferation and function.            | cell-mediated immune response and      |
|   | Exemplary assays that test for         | alternatively suppressing a B cell-    |
|   | immunomodulatory proteins evaluate     | mediated immune response. Highly       |
|   | the production of cytokines, such as   | preferred indications include          |
|   | IL-6, and the stimulation and          | inflammation and inflammatory          |
|   | upregulation of T cell proliferation   | disorders. Additional highly preferred |
|   | and functional activities. Such        | indications include asthma and         |
|   | assays that may be used or routinely   | allergy. Highly preferred indications  |
|   | modified to test immunomodulatory      | include neoplastic diseases (e.g.,     |
|   | and diffferentiation activity of       | myeloma, plasmacytoma, leukemia,       |
|   | polypeptides of the invention          | lymphoma, melanoma, and/or as          |
|   | (including antibodies and agonists or  | described below under                  |
|   | antagonists of the invention) include  | "Hyperproliferative Disorders").       |
|   | assays disclosed in Miraglia et al., J | Highly preferred indications include   |
|   | Biomolecular Screening 4:193-          | neoplasms and cancers, such as,        |
|   | 204(1999); Rowland et al.,             | myeloma, plasmacytoma, leukemia,       |
| _ | "Lymphocytes: a practical approach"    | lymphoma, melanoma, and prostate,      |
|   | Chapter 6:138-160 (2000); and          | breast, lung, colon, pancreatic,       |
|   | Verhasselt et al., J Immunol           | esophageal, stomach, brain, liver and  |
|   | 158:2919-2925 (1997), the contents     | urinary cancer. Other preferred        |
|   | of each of which are herein            | indications include benign             |
|   | incorporated by reference in its       | dysproliferative disorders and pre-    |
|   | entirety. Human dendritic cells that   | neoplastic conditions, such as, for    |

| cse coumple, hyperplasia, metuplasia, referred and or obspatia. Preferred timications include arreina, future indications include arreina, future, procytogenia, Hodglari security diversity of the company of the compa | fite cells An highly perferred enhodiment of the invention includes a method and advanted by highly perferred and advanted by the invention in the art includes a method for inhibiting (e.g., of highly perferred indication is nicked by the invention of highly perferred indication is infection (e.g., an infection discussion of searched below under "Infections on the described below under "Infection of the searched bown under "Infection on the described below under "Infection on the described bown under "Infection of the described bown under "Infection on the described bown under "Infection of searched bown under "Infection |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 123                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| systemic lupus erythematosis,        | numpte scierosis and/or as described<br>below) and immunodeficiencies (e.g., | as described below). Additional | highly preferred indications include | inflammation and inflammatory   | disorders. Preferred indications    | also include anemia, pancytopenia, | leukopenia, thrombocytopenia,          | Hodgkin's disease, acute        | lymphocytic anemia (ALL),  | plasmacytomas, multiple myeloma, | Burkitt's lymphoma, arthritis, AIDS, | granulomatous disease, inflammatory  | bowel disease, sepsis, neutropenia, | neutrophilia, psoriasis, suppression | of immune reactions to transplanted     | organs and tissues, hemophilia,   | hypercoagulation, diabetes mellitus,   | endocarditis, meningitis, Lyme      | Disease, asthma, and allergy.    | Preferred indications also include | neoplastic diseases (e.g., leukemia, | lymphoma, and/or as described    | below under "Hyperproliferative     | Disorders"). Highly preferred         | indications include neoplasms and | cancers, such as, leukemia,    | lymphoma, prostate, breast, lung, | colon, pancreatic, esophageal,         | stomach, brain, liver, and urinary  | cancer. Other preferred indications | include benign dysproliferative | disorders and pre-neoplastic | conditions, such as, for example, | hyperplasia, metaplasia, and/or |

| _ | extotoxic effects on a variety of cells | stimulating (e g increasing) TNF       |
|---|-----------------------------------------|----------------------------------------|
|   | are well known in the art and may be    | alpha production Highly preferred      |
|   | used or routinely modified to assess    | indications include blood disorders    |
|   | the ability of polypeptides of the      | (e.g., as described below under        |
|   | invention (including antibodies and     | "Immune Activity", "Blood-Related      |
|   | agonists or antagonists of the          | Disorders", and/or "Cardiovascular     |
|   | invention) to mediate                   | Disorders"), Highly preferred          |
|   | immunomodulation, modulate              | indications include autoimmune         |
|   | inflammation and cytotoxicity.          | diseases (e.g., rheumatoid arthritis,  |
|   | Exemplary assays that test for          | systemic lupus erythematosis,          |
|   | immunomodulatory proteins evaluate      | Crohn"s disease, multiple sclerosis    |
|   | the production of cytokines such as     | and/or as described below),            |
|   | tumor necrosis factor alpha (TNFa),     | immunodeficiencies (e.g., as           |
|   | and the induction or inhibition of an   | described below), boosting a T cell-   |
|   | inflammatory or cytotoxic response.     | mediated immune response, and          |
|   | Such assays that may be used or         | suppressing a T cell-mediated          |
|   | routinely modified to test              | immune response. Additional highly     |
|   | immunomodulatory activity of            | preferred indications include          |
|   | polypeptides of the invention           | inflammation and inflammatory          |
|   | (including antibodies and agonists or   | disorders, and treating joint damage   |
|   | antagonists of the invention) include   | in patients with rheumatoid arthritis. |
|   | assays disclosed in Miraglia et al., J  | An additional highly preferred         |
|   | Biomolecular Screening 4:193-           | indication is sepsis. Highly           |
|   | 204(1999); Rowland et al.,              | preferred indications include          |
|   | "Lymphocytes: a practical approach"     | neoplastic diseases (e.g., leukemia,   |
|   | Chapter 6:138-160 (2000);               | lymphoma, and/or as described          |
|   | Verhasselt et al., Eur J Immunol        | below under "Hyperproliferative        |
|   | 28(11):3886-3890 (1198); Dahlen et      | Disorders"). Additionally, highly      |
|   | al., J Immunol 160(7):3585-3593         | preferred indications include          |
|   | (1998); Verhasselt et al., J Immunol    | neoplasms and cancers, such as,        |
|   | 158:2919-2925 (1997); and Nardelli      | leukemia, lymphoma, melanoma,          |
|   | et al., J Leukoc Biol 65:822-828        | glioma (e.g., malignant glioma),       |
|   | (1999), the contents of each of which   | solid tumors, and prostate, breast,    |
|   | are herein incorporated by reference    | lung, colon, pancreatic, esophageal,   |
|   | in its entirety. Human dendritic cells  | stomach, brain, liver and urinary      |
|   | that may be used according to these     | cancer. Other preferred indications    |
|   | assays may be isolated using            | include benign dysproliferative        |

| calcium, leading to activation of<br>calcium responsive signaling<br>pathways and alterations in cell   | functions. Exemplary assays that<br>may be used or routinely modified to<br>measure calcium flux by  | polypeptides of the invention<br>(including antibodies and agonists or | antagonists of the invention) include<br>assays disclosed in: Satin LS, et al., | Endocrinology, 136(10):4589-601<br>(1995);Mogami H, et al.,       | Endocrinology, 136(7):2960-6<br>(1995); Richardson SB, et al., | Biochem J, 288 ( Pt 3):847-51          | (1992); and, Meals, JE, et al., Cell<br>Calcium 1989 Nov-Dec:10(8):535-41 | (1989), the contents of each of which | is herein incorporated by reference in | its entirety. Pancreatic cells that may | be used according to these assays are  | ATCCTM and/or may be routinely                                | generated. Exemplary pancreatic | cells that may be used according to  | these assays include HTTT15 Cells.   | cell line established from Svrian | hamster islet cells transformed with | SV40. These cells express glucagon, | somatostatin, and glucocorticoid    | receptors. The cells secrete insulin, | which is stimulated by glucose and | glucagon and suppressed by | somatostatin or glucocorticoids. | ATTC# CRL-1777 Refs: Lord and | Ashcroft. Biochem. J. 219: 547-551; |

| Santerre et al. Proc. Natl. Acad. Sci.<br>USA 78: 4339-4343, 1981. | Assays for measuring secretion of | insulin are well-known in the art and | may be used or routinely modified to   | assess the ability of polypeptides of | the invention (including antibodies   | and agonists or antagonists of the   | invention) to stimulate insulin   | secretion. For example, insulin        | secretion is measured by FMAT      | using anti-rat insulin antibodies.   | Insulin secretion from panercatic beta | cells is upregulated by glucose and | also by certain proteins/peptides, and | disregulation is a key component in | diabetes. Exemplary assays that may | be used or routinely modified to test | for stimulation of insulin secretion | (from pancreatic cells) by       | polypeptides of the invention       | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in: Ahren, B., et al., | Am J Physiol, 277(4 Pt 2):R959-66 | (1999); Li, M., et al., Endocrinology, | 138(9):3735-40 (1997); Kim, K.H., | et al., FEBS Lett, 377(2):237-9 | (1995); and, Miraglia S et. al., | Journal of Biomolecular Screening, | 4:193-204 (1999), the contents of      | each of which is herein incorporated | by reference in its entirety.       | Pancreatic cells that may be used    | according to these assays are publicly | available (e.g., through the ATCCTM) | and/or may be routinely generated.     |
|                                                                    | Stimulation of insulin            | secretion from                        | pancreatic beta cells.                 |                                       |                                       |                                      |                                   |                                        |                                    |                                      |                                        |                                     |                                        |                                     |                                     |                                       |                                      |                                  |                                     |                                       |                                       |                                         |                                   |                                        |                                   |                                 |                                  |                                    |                                        |                                      |                                     |                                      |                                        |                                      |                                        |

Assays for a minimumonouliatory providers that are produced by a large variety of cells and act to inclue e-benotaxis and activation of monocytes and Teels are well known in the art and may be used or routinely modified to assess and a realization to physphetics of the invention (including antibodies and agrounds or agrounds or agrounds or and art and the minimumonoulation, induce cell activation. Exempliary assays proteins evaluate the production of cell articles minimumonoulation to mediate the production of cell articles minimumonoulation proceins evaluate the production of cell articles miners, such as monocyte chemostrate and profile.                                                                                                                                                                                                                                              |

| of each of which are herein incorporated by reference in its entirey. Mouse adipocyte cells that may be used according to these assays are publicly available (e.g., | through the ATC(2"9). Exemplary mouse adjooyte cells that may be used according to these assays include 373-Lt cells. 373-Lt is an adherent mouse preadineys cell line that is a continous subsenio of 313 finebals accleding through cells in the design of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of the state of | pre-adjoorge or adjoose-like conversion under appropriate differentiation conditions known in the art.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|  | organization on groundstate             |
|  | associated with insulin resistance.     |
|  | Additional highly preferred             |
|  | indications are disorders of the        |
|  | musculoskeletal systems including       |
|  | myopathies, muscular dystrophy,         |
|  | and/or as described herein.             |
|  | Additional highly preferred             |
|  | indications include glycogen storage    |
|  | disease (e.g., glycogenoses),           |
|  | hepatitis, gallstones, cirrhosis of the |
|  | liver, degenerative or necrotic liver   |
|  | disease, alcoholic liver diseases,      |
|  | fibrosis, liver regeneration, metabolic |
|  | disease, dyslipidemia and cholesterol   |
|  | metabolism, and hepatocarcinomas.       |
|  | Highly preferred indications include    |
|  | blood disorders (e.g., as described     |
|  | below under "Immune Activity",          |
|  | "Cardiovascular Disorders", and/or      |
|  | "Blood-Related Disorders"), immune      |
|  | disorders (e.g., as described below     |
|  | under "Immune Activity"), infection     |
|  | (e.g., an infectious disease and/or     |
|  | disorder as described below under       |
|  | "Infectious Disease"), endocrine        |
|  | disorders (e.g., as described below     |
|  | under "Endocrine Disorders"), and       |
|  | neural disorders (e.g., as described    |
|  | below under "Neural Activity and        |
|  | Neurological Diseases").                |
|  | Additional preferred indications        |
|  | include neoplastic diseases (e.g., as   |
|  | described below under                   |
|  | "Hyperproliferative Disorders").        |
|  | Preferred indications include           |
|  | neoplasms and cancers, such as,         |

| chemotaxis, and/or mediate humoral | or cell-mediated immunity. | Exemplary assays that test for | immunomodulatory proteins evaluate | the production of cytokines, such as | RANTES, and the induction of | chemotactic responses in immune | cells. Such assays that may be used | or routinely modified to test | immunomodulatory activity of | polypeptides of the invention | (including antibodics and agonists or | antagonists of the invention) include | the assays disclosed in Miraglia et | al., J Biomolecular Screening 4:193- | 204 (1999); Rowland et al., | "Lymphocytes: a practical approach" | Chapter 6:138-160 (2000): Cocchi et | al., Science 270(5243);1811-1815 | (1995); and Robinson et al., Clin Exp | Immunol 101(3):398-407 (1995), the | contents of each of which are herein | incorporated by reference in its | entirety. Endothelial cells that may | be used according to these assays are | publicly available (e.g., through the | ATCC <sup>TM</sup> ). Exemplary endothelial | cells that may be used according to | these assays include human umbilical | vein endothelial cells (HUVEC), | which are endothelial cells which | line venous blood vessels, and are | involved in functions that include, | but are not limited to, angiogenesis, | vascular permeability, vascular tone, | and immune cell extravasation. | Caspase Apoptosis. Assays for    |
|                                    |                            |                                |                                    |                                      |                              |                                 |                                     |                               |                              |                               |                                       | _                                     |                                     |                                      |                             |                                     |                                     |                                  |                                       |                                    |                                      |                                  |                                      |                                       |                                       |                                             |                                     |                                      |                                 |                                   |                                    |                                     |                                       |                                       |                                | Regulation of apoptosis          |

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 143                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|   | the ability of polypeptides of the           | diabetes (e.g., diabetic retinopathy,  |
|---|----------------------------------------------|----------------------------------------|
|   | invention (including antibodies and          | diabetic nephropathy, kidney disease   |
|   | agonists or antagonists of the               | (e.g., renal failure, nephropathy      |
|   | invention) to regulate viability and         | and/or other diseases and disorders as |
|   | proliferation of pancreatic beta cells.      | described in the "Renal Disorders"     |
|   | For example, the Cell Titer-Glo              | section below), diabetic neuropathy,   |
|   | luminescent cell viability assay             | nerve disease and nerve damage         |
|   | measures the number of viable cells          | (e.g., due to diabetic neuropathy),    |
|   | in culture based on quantitation of          | blood vessel blockage, heart disease,  |
|   | the ATP present which signals the            | stroke, impotence (e.g., due to        |
|   | presence of metabolically active             | diabetic neuropathy or blood vessel    |
|   | cells. Exemplary assays that may be          | blockage), seizures, mental            |
|   | used or routinely modified to test           | confusion, drowsiness, nonketotic      |
|   | regulation of viability and                  | hyperglycemic-hyperosmolar coma,       |
|   | proliferation of pancreatic beta cells       | cardiovascular disease (e.g., heart    |
|   | by polypeptides of the invention             | disease, atherosclerosis,              |
|   | (including antibodics and agonists or        | microvascular disease, hypertension,   |
|   | antagonists of the invention) include        | stroke, and other diseases and         |
|   | assays disclosed in: Friedrichsen BN,        | disorders as described in the          |
|   | et al., Mol Endocrinol, 15(1):136-48         | "Cardiovascular Disorders" section     |
|   | (2001); Huotari MA, et al.,                  | below), dyslipidemia, endocrine        |
|   | Endocrinology, 139(4):1494-9                 | disorders (as described in the         |
|   | (1998); Hugl SR, et al., J Biol Chem         | "Endocrine Disorders" section          |
|   | 1998 Jul 10;273(28):17771-9 (1998),          | below), neuropathy, vision             |
|   | the contents of each of which is             | impairment (e.g., diabetic retinopathy |
|   | herein incorporated by reference in          | and blindness), ulcers and impaired    |
|   | its entirety. Pancreatic cells that may      | wound healing, and infection (e.g.,    |
|   | be used according to these assays are        | infectious diseases and disorders as   |
|   | publicly available (e.g., through the        | described in the "Infectious           |
|   | ATCC <sup>TM</sup> ) and/or may be routinely | Diseases" section below, especially    |
| _ | generated. Exemplary pancreatic              | of the urinary tract and skin), carpal |
|   | cells that may be used according to          | tunnel syndrome and Dupuytren's        |
|   | these assays include rat INS-1 cells.        | contracture). An additional highly     |
|   | INS-1 cells are a semi-adherent cell         | preferred indication is obesity and/or |
|   | line established from cells isolated         | complications associated with          |
|   | from an X-ray induced rat                    | obesity. Additional highly preferred   |
|   | transplantable insulinoma. These             | indications include weight loss or     |

|     |         |     |                                                                                                                         | available (e.g., through the ATIC/TV) available (e.g., through the ATIC/TV) Exemplary pancreatic cells that may be not according to these usays include at INS-L cells. INS-L cells are a semi-adherent cell line are a semi-adherent cell line are a semi-adherent cell line are a semi-adherent cell line are a semi-adherent cell line are a semi-adherent cell line are a semi-adherent cell line are semi-adherent cell line are semi-adherent cell line are semi-adherent cell line are semi-adherent cell line are semi-adherent cell intention are semi-adherent cells insulant characteristics typical of mative paractaic bear cells including glucose inducible insulin secretion.                                                                                                                       | Diseases' section below, especially between the first times to biseases' section below, especially turned syndrome and Dispuyeren's for turner times and Dispuyeren's An additional highly preferred indication is obesity and or complications associated with one or complications associated with one or complications associated with and or complications include weight loss or indications include weight loss or indications include weight loss or Additional lightly preferred indications are complications associated with instillur resistance.                                                                                                             |

| disregulation is a key component in<br>diabetee Evermlary assays that may | be used or routinely modified to test | for stimulation of insulin secretion | (from pancreatic cells) by       | polypeptides of the invention       | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in: Shimizu, H., et | al., Endocr J, 47(3):261-9 (2000); | Salapatek, A.M., et al., Mol       | Endocrinol, 13(8):1305-17 (1999); | Filipsson, K., et al., Ann N Y Acad | Sci, 865:441-4 (1998); Olson, L.K., | et al., J Biol Chem, 271(28):16544- | 52 (1996); and, Miraglia S et. al.,    | Journal of Biomolecular Screening,  | 4:193-204 (1999), the contents of   | each of which is herein incorporated | by reference in its entirety. | Pancreatic cells that may be used   | according to these assays are publicly | available (e.g., through the ATCCTM) | and/or may be routinely generated. | Exemplary pancreatic cells that may    | be used according to these assays    | include HITT15 Cells. HITT15 are     | an adherent epithelial cell line   | established from Syrian hamster islet  | cells transformed with SV40. These | cells express glucagon, somatostatin, | and glucocorticoid receptors. The | cells secrete insulin, which is | stimulated by glucose and glucagon | and suppressed by somatostatin or | glucocorticoids. ATTC# CRL-1777 | Refs: Lord and Ashcroft. Biochem. |

| J. 219: 547-551; Santerre et al. Proc.<br>Natl. Acad. Sci. USA 78: 4339-4343,<br>1981. | Assays for the regulation of<br>transcription through the DMEF1<br>response element are well-known in<br>the art and may be used or routinely<br>modified to assess the ability of | polypeptides of the invention (including anti-backs and agonists or antagonists of the invention) to activate the DMEF1 response element in a reporter construct (such as that containing the CLUT4                                  | promoter) and to regulate insulin<br>production. The DMFFI response<br>element is present in the GLUT4<br>promoter and binds to MEF2<br>transcription factor and another              | transcription factor that is required for insulin regulation of Glud- ocypession in skeletal muscle. (CLUT4 is the primary insulin- responsive gluose transporter in fat  and muscle tissue. Exemplary assays  that may be used or routinely         | modified to lest for DMLH response<br>element activity (in adipocytes and<br>pre-adipocytes) by polypeptides of<br>the invention (including antibodies<br>and agentist or antagonists of the<br>invention) include assays disclosed<br>in That, M.V., et al., J Biol Chem.<br>777(23);1428-92 (1998); Mons, S. | et al., J Biol Chem, 275(21):16323-8<br>(2000); Liu, M.L., et al., J Biol<br>Chem, 269(45):28514-21 (1994); |

| invention includes a method for<br>inhibiting (e.g., reducing) TNF alpha<br>producion. An alternative preferred<br>embodiment of the invention<br>includes a method for stimulating | eg., increasing DNF appla<br>production. Preferred indications<br>include blood dissorders (e.g., as<br>described below under "Immune<br>Artivity", "Blood-Related<br>Bosterles", and "C'ardivosacular<br>Dissorders", and "C'ardivosacular<br>Dissorders", Highly preferred<br>indications include autoimmune<br>viscose (e.g. rheumanda arthritis                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | and patients with thermunoid arthritis, An additional highly preferred indication is segais. Highly preferred indications include norphissio diseases (e.g., Latkemia, hyphoran, and on se described below under "Hyperpositientive below under "Hyperpositientive below under "Hyperpositientive preferred indications include norphisms and cancers, such as, for example, latkemia, lymphoma, melanoma, giorne (e.g., milignant melanoma, giorne (e.g., milignant |

| using anti-rat insulin antibodies. | Insulin secretion from pancreatic beta | cells is upregulated by glucose and | also by certain proteins/peptides, and | disregulation is a key component in | diabetes. Exemplary assays that may | be used or routinely modified to test | for stimulation of insulin secretion | (from pancreatic cells) by       | polypeptides of the invention       | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in: Ahren, B., et al., | Am J Physiol, 277(4 Pt 2):R959-66 | (1999); Li, M., et al., Endocrinology, | 138(9):3735-40 (1997); Kim, K.H., | et al., FEBS Lett, 377(2):237-9 | (1995); and, Miraglia S et. al., | Journal of Biomolecular Screening, | 4:193-204 (1999), the contents of      | each of which is herein incorporated | by reference in its entirety.       | Pancreatic cells that may be used | according to these assays are publicly | available (e.g., through the ATCCTM) | and/or may be routinely generated.     | Exemplary pancreatic cells that may | be used according to these assays | include rat INS-1 cells. INS-1 cells   | are a semi-adherent cell line        | established from cells isolated from | an X-ray induced rat transplantable | insulinoma. These cells retain | characteristics typical of native | pancreatic beta cells including | glucose inducible insulin secretion. |
|                                    |                                        |                                     |                                        |                                     |                                     |                                       |                                      |                                  |                                     |                                       |                                       |                                         |                                   |                                        |                                   |                                 |                                  |                                    |                                        |                                      |                                     |                                   |                                        |                                      |                                        |                                     |                                   |                                        |                                      |                                      |                                     |                                |                                   |                                 |                                      |
|                                    |                                        |                                     |                                        |                                     |                                     |                                       |                                      |                                  |                                     |                                       |                                       |                                         |                                   |                                        |                                   |                                 |                                  |                                    |                                        |                                      |                                     |                                   |                                        |                                      |                                        |                                     |                                   |                                        |                                      |                                      |                                     |                                |                                   |                                 |                                      |

|                             | A highly preferred embodiment    | of the invention includes a method | for stimulating adipocyte             | proliferation. An alternative highly  | preferred embodiment of the          | invention includes a method for      | inhibiting adipocyte proliferation. | A highly preferred embodiment of    | the invention includes a method for | stimulating adipocyte differentiation. | An alternative highly preferred | embodiment of the invention           | includes a method for inhibiting     | adipocyte differentiation. A      | highly preferred embodiment of the | invention includes a method for | stimulating (e.g., increasing)        | adipocyte activation. An alternative  | highly preferred embodiment of the     | invention includes a method for | inhibiting the activation of (e.g., | decreasing) and/or inactivating | adipocytes. Highly preferred        | indications include endocrine     | disorders (e.g., as described below | under "Endocrine Disorders").    | Highly preferred indications also | include neoplastic diseases (e.g., | lipomas, liposarcomas, and/or as | described below under            | "Hyperproliferative Disorders").     | Preferred indications include blood | disorders (e.g., hypertension,       | congestive heart failure, blood vessel | blockage, heart disease, stroke,  | impotence and/or as described below |

| Endocrinology 1992 130:167. | Kinase assay. Kinase assays, for | example an Elk-1 kinase assay, for | ERK signal transduction that regulate | cell proliferation or differentiation | are well known in the art and may be | used or routinely modified to assess | the ability of polypeptides of the  | invention (including antibodies and | agonists or antagonists of the      | invention) to promote or inhibit cell  | proliferation, activation, and  | differentiation. Exemplary assays for | ERK kinase activity that may be used | or routinely modified to test ERK | kinase-induced activity of         | polypeptides of the invention   | (including antibodics and agonists or | antagonists of the invention) include | the assays disclosed in Forrer et al., | Biol Chem 379(8-9):1101-1110    | (1998); Le Marchand-Brustel Y, Exp  | Clin Endocrinol Diabetes        | 107(2):126-132 (1999); Kyriakis JM, | Biochem Soc Symp 64:29-48 (1999); | Chang and Karin, Nature             | 410(6824):37-40 (2001); and Cobb | MH, Prog Biophys Mol Biol 71(3-   | 4):479-500 (1999); the contents of | each of which are herein         | incorporated by reference in its | entirety. Mouse adipocyte cells that | may be used according to these      | assays are publicly available (e.g., | through the ATCCTM). Exemplary         | mouse adipocyte cells that may be | used according to these assays      |
|                             | Activation of                    | Adipocyte ERK                      | Signaling Pathway                     |                                       |                                      |                                      |                                     |                                     |                                     |                                        |                                 |                                       |                                      |                                   |                                    |                                 |                                       |                                       |                                        |                                 |                                     |                                 |                                     |                                   |                                     |                                  |                                   |                                    |                                  |                                  |                                      |                                     |                                      |                                        |                                   |                                     |

| of the invention includes a method | for stimulating MIP1a production.     | An alternative highly preferred | embodiment of the invention    | includes a method for inhibiting (e.g., | reducing) MIP1a production. A | highly preferred indication is    | infection (e.g., an infectious disease | as described below under "Infectious  | Disease"). Preferred indications | include blood disorders (e.g., as | described below under "Immune     | Activity", "Blood-Related         | Disorders", and/or "Cardiovascular | Disorders"). Highly preferred      | indications include autoimmune     | diseases (e.g., rheumatoid arthritis, | systemic lupus erythematosis,        | multiple sclerosis and/or as described | below) and immunodeficiencies (e.g., | as described below). Additional | highly preferred indications include | inflammation and inflammatory   | disorders. Preferred indications    |                                | _                                      | Hodgkin's disease, acute        | lymphocytic anemia (ALL),  | plasmacytomas, multiple myeloma, | Burkitt's lymphoma, arthritis, AIDS, | granulomatous disease, inflammatory  | bowel disease, sepsis, neutropenia, | neutrophilia, psoriasis, suppression | of immune reactions to transplanted     | organs and tissues, hemophilia,   | _                                      | endocarditis, meningitis, Lyme      |
| immunomodulatory profeins          | produced by activated dendritic cells | that upregulate                 | monocyte/macrophage and T cell | chemotaxis are well known in the art    | and may be used or routinely  | modified to assess the ability of | polypeptides of the invention          | (including antibodies and agonists or | antagonists of the invention) to | mediate immunomodulation,         | modulate chemotaxis, and modulate | T cell differentiation. Exemplary | assays that test for               | immunomodulatory proteins evaluate | the production of chemokines, such | as macrophage inflammatory protein    | 1 alpha (MIP-1a), and the activation | of monocytes/macrophages and T         | cells. Such assays that may be used  | or routinely modified to test   | immunomodulatory and chemotaxis      | activity of polypeptides of the | invention (including antibodies and | agonists or antagonists of the | invention) include assays disclosed in | Miraglia et al., J Biomolecular | Screening 4:193-204(1999); | Rowland et al., "Lymphocytes: a  | practical approach" Chapter 6:138-   | 160 (2000); Satthaporn and Eremin, J | R Coll Surg Ednb 45(1):9-19 (2001); | Drakes et al., Transp Immunol        | 8(1):17-29 (2000); Verhasselt et al., J | Immunol 158:2919-2925 (1997); and | Nardelli et al., J Leukoc Biol 65:822- | 828 (1999), the contents of each of |

| inflammatory or cytotoxic response. | Such assays that may be used or | routinely modified to test         | immunomodulatory activity of  | polypeptides of the invention | (including antibodies and agonists or | antagonists of the invention) include  | assays disclosed in Miraglia et al., J | Biomolecular Screening 4:193- | 204(1999); Rowland et al.,    | "Lymphocytes: a practical approach"  | Chapter 6:138-160 (2000);     | Verhasselt et al., Eur J Immunol | 28(11):3886-3890 (1198); Dahlen et | al., J Immunol 160(7):3585-3593 | (1998); Verhasselt et al., J Immunol | 158:2919-2925 (1997); and Nardelli | et al., J Leukoc Biol 65:822-828 | (1999), the contents of each of which | are herein incorporated by reference | in its entirety. Human dendritic cells | that may be used according to these | assays may be isolated using    | techniques disclosed herein or | otherwise known in the art. Human | dendritic cells are antigen presenting | cells in suspension culture, which, | when activated by antigen and/or | cytokines, initiate and upregulate T | cell proliferation and functional | activities.               |                                  |                                      |                                     |                             |                                      |                                     |

| sources. The expression of VCAM (CD106), a membran-associated protein, can be upregulated by cookings on other factors, and contributes to the extravassion of by priphocytes, leuncytes and other immune cells from blood vessels, thus VCAM expression plays as not inflammatory responses. | treassay for the activation of treassay for the activation of treassary for the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the activation of the acti |

| disordens. Highly preferred indisordens. Highly preferred disordens indications include reoplastic diseases (e.g., Intkernia, Jopahona, and ora sedescholer below under "Hyperproliterative Disorders"). Highly preferred indications include neoplasms and cancers, such as, for example, lenkennia, lymphoma (e.g., Teal lymphoma, Hodgiri's disease). Indiportant indigitative diseases, lymphoma, indiportant prostate, developing include being only marcatic coophingent, someon, breit, liver and urinary someon, parcetaire, esophageal, someon, Deriver and urinary conditions, such as, for example, preparation of the proper last intenditions, and preparation diseases, and many objectived indications include being desproliterative diseases, conditiones, such as, for example, lymphocytica enemia (ALI.) plasmocytoma, multiple myelom, artitle indications in termspirated organic ananyopoma, artitritis, AIDS, granulomatous subjections to transpirated organic and increases, informatous benefit diseases, segus, incumporal, neuroporal, neuroporal, neuroporal, neuroporal, artitritis, AIDS, granulomatous edgesses, informatopatial, activating in Lympe reactions to transpirated organic and placery. | A highly preferred embodiment of<br>the invention includes a method for<br>stimulating (e.g., increasing) MCP-1<br>production. An alternative highly |

| preferred embodiment of the         | invention includes a method for      | inhibiting (e.g., reducing) MCP-1    | production. A highly preferred     | indication is infection (e.g., an   | infectious disease as described below | under "Infectious Disease"). | Additional highly preferred | indications include inflammation and | inflammatory disorders. Preferred | indications include blood disorders | (e.g., as described below under     | "Immune Activity", "Blood-Related | Disorders", and/or "Cardiovascular | Disorders"). Highly preferred | indications include autoimmune     | discases (e.g., rheumatoid arthritis, | systemic lupus erythematosis,     | multiple sclerosis and/or as described | below) and immunodeficiencies (e.g., | as described below). Preferred        | indications also include anemia,      | pancytopenia, leukopenia,              | thrombocytopenia, Hodgkin's   | disease, acute lymphocytic anemia | (ALL), plasmacytomas, multiple      | myeloma, Burkitt's lymphoma, | arthritis, AIDS, granulomatous  | disease, inflammatory bowel disease, | sepsis, neutropenia, neutrophilia, | psoriasis, suppression of immune   | reactions to transplanted organs and | tissues, hemophilia,             | hypercoagulation, diabetes mellitus, | endocarditis, meningitis (bacterial | and viral), Lyme Disease, asthma, | and allergy Preferred indications |
| activation of monocytes and T cells | are well known in the art and may be | used or routinely modified to assess | the ability of polypeptides of the | invention (including antibodies and | agonists or antagonists of the        | invention) to mediate        | immunomodulation, induce    | chemotaxis, and modulate immune      | cell activation. Exemplary assays | that test for immunomodulatory      | proteins evaluate the production of | cell surface markers, such as     | monocyte chemoattractant protein   | (MCP), and the activation of  | monocytes and T cells. Such assays | that may be used or routinely         | modified to test immunomodulatory | and diffferentiation activity of       | polypeptides of the invention        | (including antibodies and agonists or | antagonists of the invention) include | assays disclosed in Miraglia et al., J | Biomolecular Screening 4:193- | 204(1999); Rowland et al.,        | "Lymphocytes: a practical approach" | Chapter 6:138-160 (2000);    | Satthaporn and Eremin, J R Coll | Surg Ednb 45(1):9-19 (2001); and     | Verhasselt et al., J Immunol       | 158:2919-2925 (1997), the contents | of each of which are herein          | incorporated by reference in its | entirety. Human dendritic cells that | may be used according to these      | assays may be isolated using      | techniques disclosed herein or    |
|                                     |                                      |                                      |                                    |                                     |                                       |                              |                             |                                      |                                   |                                     |                                     |                                   |                                    |                               |                                    |                                       |                                   |                                        |                                      |                                       |                                       |                                        |                               |                                   |                                     |                              |                                 |                                      |                                    |                                    |                                      |                                  |                                      |                                     |                                   | _                                 |

|     |         |     |                    |                                   | pre-neoplastic conditions, such as,          |
|     |         |     |                    |                                   | hyperplasia, metaplasia, and/or<br>dvsnlasia |
|     | HNGJE50 | 564 | Production of IL-6 | IL-6 FMAT. IL-6 is produced by T  | A highly preferred embodiment of             |
| 160 |         |     |                    | cells and has strong effects on B | the invention includes a method for          |
|     |         |     |                    | cells. IL-6 participates in IL-4  | stimulating (e.g., increasing) IL-6          |

|   | 3 -                                    | 3                                     |
|---|----------------------------------------|---------------------------------------|
| _ | induced tgr production and increases   | production. An alternative inginy     |
|   | IgA production (IgA plays a role in    | preferred embodiment of the           |
|   | mucosal immunity). IL-6 induces        | invention includes a method for       |
|   | cytotoxic T cells. Deregulated         | inhibiting (e.g., reducing) IL-6      |
|   | expression of IL-6 has been linked to  | production. A highly preferrred       |
|   | autoimmune disease, plasmacytomas,     | indication is the stimulation or      |
|   | myelomas, and chronic                  | enhancement of mucosal immunity.      |
|   | hyperproliferative diseases. Assays    | Highly preferred indications include  |
|   | for immunomodulatory and               | blood disorders (e.g., as described   |
|   | differentiation factor proteins        | below under "Immune Activity",        |
|   | produced by a large variety of cells   | "Blood-Related Disorders", and/or     |
|   | where the expression level is strongly | "Cardiovascular Disorders"), and      |
|   | regulated by cytokines, growth         | infection (e.g., as described below   |
|   | factors, and hormones are well         | under "Infectious Disease"). Highly   |
|   | known in the art and may be used or    | preferred indications include         |
|   | routinely modified to assess the       | autoimmune diseases (e.g.,            |
|   | ability of polypeptides of the         | rheumatoid arthritis, systemic lupus  |
|   | invention (including antibodies and    | erythematosis, multiple sclerosis     |
|   | agonists or antagonists of the         | and/or as described below) and        |
|   | invention) to mediate                  | immunodeficiencies (e.g., as          |
|   | immunomodulation and                   | described below). Highly preferred    |
|   | differentiation and modulate T cell    | indications also include boosting a B |
|   | proliferation and function.            | cell-mediated immune response and     |
|   | Exemplary assays that test for         | alternatively suppressing a B cell-   |
|   | immunomodulatory proteins evaluate     | mediated immune response. Highly      |
|   | the production of cytokines, such as   | preferred indications include         |
|   | IL-6, and the stimulation and          | inflammation and inflammatory         |
|   | upregulation of T cell proliferation   | disorders.Additional highly preferred |
|   | and functional activities. Such        | indications include asthma and        |
|   | assays that may be used or routinely   | allergy. Highly preferred indications |
|   | modified to test immunomodulatory      | include neoplastic diseases (e.g.,    |
|   | and diffferentiation activity of       | myeloma, plasmacytoma, leukemia,      |
|   | polypeptides of the invention          | lymphoma, melanoma, and/or as         |
|   | (including antibodies and agonists or  | described below under                 |
|   | antagonists of the invention) include  | "Hyperproliferative Disorders").      |
|   | assays disclosed in Miraglia et al., J | Highly preferred indications include  |
|   | Biomolecular Screening 4:193-          | neoplasms and cancers, such as,       |

| 73                                                                                                                                                                                                                 |                                                                                                                                                                                                                                           |                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                             | ø                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| myclonna, plasmacytoma, leukemia,<br>lymphoma, melanoma, and prostate,<br>breast, lung, colon, panceadic,<br>esophageal, stomach, brain, liver and<br>uniany cancer. Other preferred<br>indications include benign | dysproliferative disorders and pre-<br>noplastic conditions, such as, for<br>example, hyperplasia, metaplasia,<br>and/or dysplasia. Preferred<br>indications include anemia,<br>pancytopenia, lenkopenia,<br>thrombocytopenia, Hodgkin's  | dusease, acute lymphocytic anorma<br>(ALL), multiple myeloma, Burkitt's<br>lymphoma, arthritis, AIDS,<br>granulonatous disease, inflammatory<br>bowel disease, sepsis, neutropenia, | entuophilia, postivais, suppression<br>of immune reactions to transplanted<br>agrees and fisses, hemophilia,<br>hypercoagulation, diabetes mellitus,<br>endocauditis, meningitis, and Lyme<br>Dessee. An additional preferred<br>indication is infection (e.g., an<br>infection disease as described below<br>mader "Infections Diseases"). | thigh preferred indication is discheres realitins. An additional highly preferred indication is a complication secondicated with discheres (e.g., discheric retinopathy, ickiney discheres (e.g., renal failure, rephropathy, ickiney discheres (e.g., renal failure, rephropathy andie order disenses and disorders as described in the Kenal Disouders's section below, dischere conserved in the Section Polowy, discheric resurpostity, section Polowy, dischere and secretors and section Polowy, dischere the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property of the property o |
| 204(1999); Rowland et al., "Lymphocytes: a practical approach" Chapter 6:138-160 (2000); and Verhasselt et al., J Immunol 158:2919-2925 (1997), the contents of each of which are berein                           | incorporated by reference in its entirely. Human deadrific cells that may be used according to these assays may be isolated using techniques disolosed herein or olderwise known in the art. Human dendritic cells are antigen presenting | cells in suspension culture, which, when activated by antigen and/or cytokines, initiate and upregulate T cell proliferation and functional activities.                             |                                                                                                                                                                                                                                                                                                                                             | Assays for measuring excertion of insulin are well-known in the art and may be used or routinely modified to assess the ability of polypeptides of the invention (including authodics the invention (including authodics of the invention) to stimulate insulin secuetion. For example, insulin secuetion is necessared by IPAAT using anti-art insulin antibodies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Insulin secretion from pancreatic beta cells is upregulated by glucose and also by cortain proteins honties and | also by certain proteins/peptides, and disregulation is a key component in diabetes. Exemplary assays that may be used or manipular modified to test. | for stimulation of insulin secretion<br>(from pancreatic cells) by | polypeptides of the invention<br>(including antibodies and agonists or | assays disclosed in: Shimizu, H., et                                | al., Endocr J, 47(3):261-9 (2000);<br>Salapatek, A.M., et al., Mol  | Endocrinol, 13(8):1305-17 (1999);<br>Filipsson, K., et al., Ann N Y Acad | Sci, 865:441-4 (1998); Olson, L.K., | 52 (1996); and, Miraglia S et. al.,    | Journal of Biomolecular Screening,<br>4:193-204 (1999), the contents of    | each of which is herein incorporated | by reference in its entirety.  Pancreatic cells that may be used    | according to these assays are publicly | available (e.g., through the ATCCTM) | and/or may be rounnely generated.  Exemplary pancreatic cells that may | be used according to these assays    | include HITT15 Cells. HITT15 are     | an adherent epithelial cell line   | cells transformed with SV40. These                                         | cells express glucagon, somatostatin, | and glucocorticoid receptors. The | cells secrete insulin, which is | stimulated by glucose and glucagon |
|                                                                                                                 |                                                                                                                                                       |                                                                    |                                                                        |                                                                     |                                                                     |                                                                          |                                     |                                        |                                                                            |                                      |                                                                     |                                        |                                      |                                                                        |                                      |                                      |                                    |                                                                            |                                       |                                   |                                 |                                    |

|  | indications are complications           |
|--|-----------------------------------------|
|  | mercanons are compromise                |
|  | associated with insulin resistance.     |
|  | Additional highly preferred             |
|  | indications are disorders of the        |
|  | musculoskeletal systems including       |
|  | myopathies, muscular dystrophy,         |
|  | and/or as described herein.             |
|  | Additional highly preferred             |
|  | indications include glycogen storage    |
|  | disease (e.g., glycogenoses),           |
|  | hepatitis, gallstones, cirrhosis of the |
|  | liver, degenerative or necrotic liver   |
|  | disease, alcoholic liver diseases,      |
|  | fibrosis, liver regeneration, metabolic |
|  | disease, dyslipidemia and cholesterol   |
|  | metabolism, and hepatocarcinomas.       |
|  | Highly preferred indications include    |
|  | blood disorders (e.g., as described     |
|  | below under "Immune Activity",          |
|  | "Cardiovascular Disorders", and/or      |
|  | "Blood-Related Disorders"), immune      |
|  | disorders (e.g., as described below     |
|  | under "Immune Activity"), infection     |
|  | (e.g., an infectious disease and/or     |
|  | disorder as described below under       |
|  | "Infectious Disease"), endocrine        |
|  | disorders (e.g., as described below     |
|  | under "Endocrine Disorders"), and       |
|  | neural disorders (e.g., as described    |
|  | below under "Neural Activity and        |
|  | Neurological Diseases").                |
|  | Additional preferred indications        |
|  | include neoplastic diseases (e.g., as   |
|  | described below under                   |
|  | "Hyperproliferative Disorders").        |
|  | Preferred indications include           |
|  | neoplasms and cancers, such as,         |

|     |         |     |                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | the detail, hypholom, prostate, breast, lung, colon, pancretatic, colon, pancretatic, colon, pancretatic, colon, pancretatic, and urinary cancer.
